ABSTRACT OF THE DISCLOSURE

Disclosed is a selective document processing system and method. The selective document processing system includes a digital document analyzer configured

5   to determine a number of regions on a digital document and a data type for each of the regions, the data type for each region being one of a number of predefined data types. The system also includes a first user interface to display the analyzed digital document and to allow the user to perform various functions relative to the displayed digital document including selecting desired regions, deleting regions, *etc*. The system also

10   includes a selection interface activated from the first user interface for identifying at least one of the predefined data types that are displayed on the first user interface and that are further processed in predetermined processing pipelines.
